

FOOT LOCKER UK · PDP PROPOSAL

Giving the product description more real estate

A proposal and working prototype for surfacing the product description on the Foot Locker UK product detail page — with three differentiated treatments, the KPIs to judge them by, and a recommended path to ship.

Front-end proposal · Prototype accompanies this document ([index.html](#))

1. The brief, and what it actually means

The request was: *"Our product description in the PDP is very hidden — we want to give it more real estate."*

The key word is **description**. This is not about the buy box (price, size, Add to Bag) — it is specifically about the descriptive and feature content. On the live PDP that content is the worst-placed element on the page: it sits inside a collapsed "Details" accordion as the **last** thing on the page, below the buy box, the shipping selector and the discount-exclusion notice. The copy itself is fine; its placement and presentation make it effectively invisible.

"More real estate" is the proposed *solution*, not the goal. The underlying goal is to help customers understand the product, so they buy with confidence and return less. This proposal treats real estate as the means and measures against those real outcomes.

2. What the current page does with the description

Pulled from the live Air Force 1 PDP, the description block contains good raw material, poorly deployed:

- A product code / supplier SKU
- A styled subhead ("Nature-inspired comfort") and a short marketing paragraph
- A flat, seven-item feature list (canvas upper, leather accents, padded collar, foam midsole, Nike Air, rubber outsole, 20% recycled content)

The problems are placement and form, not content: it is **collapsed by default** (so most users never see it), it is **last on the page**, the specs are an unscannable bullet list, and there is **no imagery paired with the copy**. Notably, the same text already populates the page's meta description — so it works for SEO behind the scenes but is hidden from the actual customer. That is wasted content.

3. KPIs to evaluate any change

Grouped into the metric we want to move, the metric proving the description is doing its job, and guardrails so we do not win one thing while breaking another.

CATEGORY	METRIC	WHY IT MATTERS
Primary (business)	PDP → add-to-bag rate; PDP → purchase conversion	The outcome the director ultimately cares about.
Description engagement	Description view/expand rate; scroll depth; time on description	Explains <i>why</i> conversion moved; proves the content is being consumed.
Returns	Return rate, esp. "not as expected" reasons	Footwear returns are costly; better fit/material comms reduce them. A CFO-friendly win.
SEO	Organic entrances, dwell time, pogo-sticking	On-page content outperforms content hidden in a collapsed accordion.

Support	Product-question contact rate	Fewer "what material / does it run true to size?" queries.
Guardrails	Core Web Vitals / page weight; scroll-distance-to-CTA	A richer description must not hurt load speed or push Add to Bag too far down.

Suggested test design: primary = add-to-bag or conversion; secondary = description engagement; guardrail = LCP/CLS plus return rate measured over a longer window.

4. Three differentiated options

These differ in philosophy and effort, not just styling, so they genuinely trade off against one another. All three are demonstrated live in the accompanying prototype via a toggle under the buy box.

OPTION A

Surface & Structure

Low effort · low risk

Keep the existing copy but expand it by default, move it directly beneath the buy box, and convert the flat spec list into a clean, scannable spec grid with icons. Pure information architecture plus light styling — no new content or assets. **Optimises for:** shipping this sprint and getting a test live fast.

Trade-off: makes the description visible and tidy, but not richer or more persuasive.

OPTION B

Tabbed sections with sticky sub-nav

Medium effort

Organise product information into Overview / Features & Specs / Delivery & Returns behind a tab bar, giving the description dedicated, prominent real estate that is always one tap away without an endless scroll. **Optimises for:** keeping the page compact while giving the description structure that scales across very different product types. **Trade-off:** tabs can hide content (needs engagement tracking) and demand correct accessibility semantics and crawlable in-DOM content so SEO does not suffer.

OPTION C

Editorial product story

High effort · high impact

Treat the description as a designed, image-paired narrative — alternating copy and detail/lifestyle imagery as the user scrolls. The description becomes the experience rather than a footnote.

Optimises for: brand desirability, hero / launch products, and deep SEO content. **Trade-off:** most build effort, needs photography and design assets, and carries a performance budget risk — so realistically a template variant for hero products, not every long-tail SKU.

5. Recommendation

Ship A, test it, earn B and C with data.

Release **Option A** behind a feature flag and A/B test it against the current collapsed accordion, with add-to-bag rate as the primary metric. It is the cheapest change with the clearest expected lift.

Architect the content model so **B** and **C** are progressive enhancements layered on the same data, not rewrites. Let the numbers justify them rather than assuming "bigger = better".

6. Notes on the prototype

The accompanying **index.html** recreates the PDP and lets you toggle between treatments A, B and C on identical content. It is plain HTML/CSS/JS with no build step. It was built with accessibility in mind: real buttons and links, ARIA state on interactive controls, visible keyboard focus, and semantic image alt text. Production would serve optimised imagery from the asset pipeline rather than bundling it, and any layout change would respect brand-mandated PDP rules (e.g. Nike's).

Prepared as a front-end proposal for Foot Locker UK. Product imagery is property of Nike / Foot Locker and is used for demonstration purposes only.
